                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ADF12525
NT 000501 contig on chromosome 8p21-22 or a polymorphic marker which is in linkage disequilibrium with the chromosome. The PCM1 marker is preferably D8S261, D8S2615 or D8S2616 and lies within the PCM1 gene. The novel method involves assessing two or more of the PCM1 markers single
                                                                                                                                                               This invention describes a novel method of determining the susceptibility to or diagnosis of schizophrenia comprising using a marker located in the chromosomal region 8p21-22. The method involves determining the presence or absence in a test sample of a pericentriolar material 1 (PCM1) marker which is selected from any of the microsatellite repeats present in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Determining the susceptibility of an individual to a neuropsychiatric disorder (e.g. schizophrenia) or diagnosing or prognosing the disorder comprises using a pericentriolar material 1 marker in the chromosomal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2003-532919/50.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gurling HMD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       12-DEC-2001; 2001GB-00029758.

                                                               within the intronic sequence 3' to exon 4, in exon 4, or in the intronic sequence 5' of exon 5. The PCMI marker is assessed by strand conformation polymorphic marker analysis, heteroduplex analysis or restriction fragment length polymorphism (RFLP) analysis. Schizophrenia therapy comprises screening an individual for a genetic predisposition to schizophrenia, where the predisposition is correlated with the PCMI marker and if a predisposition is identified, providing therapeutic treatment for the individual. Alternatively, the method comprises administering to a patient a substance that modulates the expression from the PCMI gene or a gene located within 1000 kbase of the PCMI locus. This sequence represents a primer sequence used to detect novel microsatellite repeats identified on the PCMI D8S2616 marker found on the NT 000501

Non-nucleotide probe for suppressing binding of detectable nucleic acid probes to undesired sequences, has aggregate nucleobase sequence homologous to randomly distributed repeat sequence of genomic nucleic acid SEQ ID NO 7; 103pp; English

WPI; 2003-421160/39.

Claim 10;

The present sequence represents a non-nucleotide probe. The probe is useful for suppressing the binding of one or more detectable nucleic ac probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an ass for determining target genomic nucleic acid of a sample. The method comprises contacting the sample with the mixture of probes (preferably comprising 5-50 probes), contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one or more detectable acid of the sample by determining the baseline of the one or more detectable acid of the sample by determining the hybridization of the one or more detectable mucleic acid of the sample by determining the hybridization of the one or more detectable mucleic acid of the sample by determining the hybridization of the one or more detectable mucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one or more detectable mucleic acid probes. detectable nucleic acid probes to cleic acid derived an assay e one ရှိ ရှိ

Cor its fragment, that is specific for a nucleic acid/nucleic acid hybrid. The sample of genomic nucleic acid to be tested and the reference of nucleic acid are labelled with detectable moiety such that hybridization of the genomic array is determined by determining the presence, absence, array is determined by determining the presence, absence, computed array comprises nucleic acid that is prepared from Corporation of the detectable nucleic acid that is prepared from Corporation of the detectable nucleic acid that is prepared from Corporation array comprises nucleic acid that is prepared from Corporation and control corporation of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
Non-nucleotide probe for suppressing binding of detectable nucleic acid probes to undesired sequences, has aggregate nucleobase sequence homologous to randomly distributed repeat sequence of genomic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                     24-SEP-2002; 2002WO-US030573

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a non-nucleotide probe. The probe is cuseful for suppressing the binding of one or more detectable nucleic acid probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an assay of detectable nucleic acid, to one or more undesired sequences in an assay of comprises contacting the sample with the mixture of probes (preferably comprises contacting the sample with the one or more detectable nucleic acid probes, and determining that the one or concern concern the sample by determining the hybridization of the one or concern the sample. The genomic nucleic acid is contained in a fixed tissue or a contain in paraffin embedded tissue material or frozen tissue sections. The contain in paraffin embedded tissue material or frozen tissue sections. The method comprises treating a sample of genomic nucleic acid with the sample using a genomic nucleic acid with the sample of penomic nucleic acid with the mixture of the probe under suitable hybridization conditions, and comparing the array to that of a control genomic nucleic acid, which are differentially labelled, the contacting the array with treated mixture of sample and control genomic nucleic acid and the array to that caused by hybridization of the probes to genomic nucleic acid, thus determining one or more variations in copy numbers of sequences in the control. The hybridization of the genomic the card of the penomic conditions, and comparing the sample as compared with the relative copy numbers of substantially identical sequences in the control. The hybridization of the genomic conditions, and comparing the caray is determined using an intercalating dye or a detectable antibody, or its fragment, that is specific for a nucleic acid/nucleic acid hybrid. The genomic array is determined by determining the presence absence, of the genomic array is determined by determining the presence absence, are presents a non-nucleotide probe of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                              Zhong
                                                                                                3
    polynucleotides, useful for NOVX-associated disorders,
```

```
parkinson's disease, epilepsy, immune disorders (osteoarthritis), hematopoietic disorders, inflammatory skin disorders, asthma, and various dyslipidemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, hematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridization probes, in chromosome mapping, tissue
                                                                                                                                                                                                                                                                                                                                                                 these, or a sequence that is at least 95 % identical to, or having one of more conservative amino acid substitutions in the polypeptides. The polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), neurodegenerative disorders, Albeimer's disease,
                                   typing, preventive medicine, and pharmacogenomics. This sequence corresponds to a forward primer for the genes encoding one of the NC polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

e.g.

Example; Page 4; 8pp; German.

This invention describes a novel method for sorting single-stranded conclusic acids by isolation and hybridisation of nucleic acid pools, then comparise that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at cleast once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture clasture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceranic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, acids (amino, carboxylic or fatty acid) or their derivatives, salts and cardivity of pharmaceuticals and/or nutritional compounds, e.g. food acitives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and can detect very small differences in pools of nucleic acid from cells. It can detect very small differences in the nucleic acid stom cell, and can detect very small differences in the mucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual capture probes used in the method of the invention.

Specifically, it refers to vectors, host cells, antibodies, CC agonists, antagonists and recombinant methods for producing proteins CC including GpCRs, secretory proteins and dual specificity phosphatases. CC The present invention describes these proteins as useful for the CC diseases such as Alzheimer's and Huntington's, inflammatory conditions CC including Crohn's disease and rheumatoid arthritis, as well as CC including Crohn's disease and rheumatoid arthritis, as well as CC inmunological, endocrine, pigmentation, haematopoietic, psychotic, CC autoimmune and muscular disorders. Accordingly, it refers to various conditions including osteoporosis, angina pectoris, hypotension, anxiety, CC allopecia, bulimia, cancer and manic depression. As such, they exhibit various activities including vulnerary, virucide, antibacterial, canalogsic, neuroprotective, nootropic, cerebroprotective, anticonvulsant, dermatological, osteopathic, antiarthritic, antianflammatory, cytostatic, hypotensive, cardiant, hypertensive, antiallergic, osteopathic, antiarthritic, antiallergic, can signification of the invention.
                                                                                                                                                                                                                  S

Tanaka I,
                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises VLA4 antagonists that may optionally be other anticancer agents for the treatment of acute leukaemia. Tantagonists of the invention may be used to treat, prevent and acute leukaemia, the VLA4 antagonists may also be used to scree candidates. The present DNA sequence represents a PCR primer thused in an example of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cancer to a disease treatment; a primer or probe for use in the method of estimating the disease risk or prognosis of an individual or for estimating a treatment response of an individual suffering from cancer to a disease treatment; an antibody directed to an epitope of a RAI gene product; and a kit for use in the method of estimating the disease risk or prognosis of an individual or for estimating a treatment response of an individual suffering from cancer to a disease treatment, comprising at least one primer or probe and optionally amplifying means for nucleic acid amplification. The novel method is useful for estimating the disease risk or prognosis of an individual or for estimating a treatment response of an individual suffering from cancer to a disease treatment. This polymorate in the sequence represents a probe used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nexo
Estimating the disease risk or prognosis of an individual by sequence
                                                                                                                                                                                                                                                 27-JUN-2002; 2002DK-00001005.

```
CC prognosis of an individual by sequence polymorphism analysis, especially color polymorphisms in the human chromosome 19q. The invention further relates concert to a disease treatment response of an individual suffering from concert to a disease treatment; a primer or probe for use in the method of estimating a treatment response of an individual suffering from cancer to a disease treatment; an antibody directed to an epitope of a RAI gene corproduct; and a kit for use in the method of estimating the disease risk or prognosis of an individual or for estimating a treatment response of an individual suffering from cancer to a disease treatment response of corprognosis of an individual or for estimating a treatment, comprising at least one primer or probe and optionally amplifying means for nucleic corisk or prognosis of an individual or for estimating at treatment response of an individual suffering from cancer to a disease treatment response of an individual suffering from cancer to a disease treatment response corplymucleotide sequence represents a primer/probe used for detecting the disease treatment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
```

The invention relates to a novel method for detecting a gene polymorphism in a human interleukin (II)-18 gene. The method involves detecting a 9 base insertion between -6311 position and -6310 position, a polymorphism at positions -5890, -5316, -4762, -4675, -3268, -689 and -640 of a polymorphism polymucleotide which consists of a fully defined sequence of 6640 base

Detecting gene polymorphism detecting adult onset still

in interleukin-18 gene of human, disease.

The method is useful for detecting gene polymorphism in II-18 gene of human and for detecting adult onset still disease. This polynucleotide sequence represents a primer of the human interleukin-18 gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 21 BP; 4 A;

                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel human NOVX nucleic acids and polypeptides. The polypeptide, nucleic acid or antibody is useful for preparing a composition for treating or preventing a NOVX-associated disorder, e.g., neurodegenerative or autoimmune disorders or cancer. The present sequence represents a probe used to isolate human NOVX genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New NOVX polypeptide, useful for preparing a preventing a NOVX-associated disorder, e.g., autoimmune disorders or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (HERR/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a set of nucleic amplification primers C capable of amplifying a VH-JH or DH-JH IGH, VK-JK or VK/intron-Kde IGK, C Vlambda-Jlambda IGL, Vbeta-Jbeta TCRB or Dbeta-CRB, Vy-JY TCRG, C Vdelta-Jdelta, Ddelta-Ddelta or Vdelta-Ddelta TCRD rearrangement C comprises a forward primer and a reverse primer. Also described: (1) a C nucleic acid amplification assay, preferably a PCR or multiplex PCR C assay, using the set of primers; (2) detecting VH-JH or DH-JH IGH, VK-JK C or VK/intron-Kde IGK, Vlambda-Jlambda IGL, Vbeta-Jbeta TCRB or Dbeta-C Jbeta TCRB, VV-JY TCRG, Vdelta-Jdelta or Vdelta-Ddelta or Vdelta-Ddelta C TCRD rearrangement; (3) detecting chromosomal translocation (11;14) (BCLg-C IGH); (4) detecting buman TBXAS1, recombination C G C TCRD rearrangement; (5) assessing clonal rearrangements and/or chromosome aberrations; and (6) a kit for the detecting at least one rearrangement C comprising the set of primers. The new set of nucleic amplification C G TCRG, Vdelta-Jdelta, Ddelta-Ddelta TCRD rearrangement C G Lambda-Jlambda IGL, Vbeta-Jbeta TCRB or VK-JK or VK/intron-C C G G IGK, Vlambda-Jlambda IGL, Vbeta-Jbeta TCRD rearrangement C G Lambda-Jlambda IGL, Vbeta-Jbeta TCRD rearrangement C G Lambda IGL, Vbeta-Jbeta TCRD rearrangement C G Lambda IGL, Vbeta-Jbeta TCRD rearrangement C G Lambda IGL, Vbeta-Jbeta TCRD Lambda IGL, Vbeta-Jbeta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The sequences given in AAT71901-72 represent a series of primer pairs cwhich were used to determine the presence or absence of the common cometation in an individual. The method comprises assessing genomic DNA from an individual for the polymorphism HHP-1, HHP-19 or HHP-29, and/or at least one non-optional comarker comprising the following microsatellite repeat alleles of group A common comprising the following microsatellite repeat alleles of group A compositionally of group B: Group A: 1990/205), 1884(235), 1A2(239), CC 184(271), 24E2(245), 2B8(206), 3321-1(197), 4073-1(182), 4440-1(180), CC 4440-2(139), 731-1(177), 590-1(148), 950-5(180), 950-5(180), 950-2(134), 950-3(165), 950-4(128), 950-5(180), 950-5(180), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAT71901-72 represent a series of primer pairs cc which were used to determine the presence or absence of the common cc method comprises assessing genomic DNA from an individual. The method comprises assessing genomic DNA from an individual for the cc method comprises assessing genomic DNA from an individual for the cc presence or absence of the HH-associated allele of the base-pair cc marker comprising the following microsatellite repeat alleles of group A cc and optionally of group B: Group A: 19D9(205), 18B4(235), 1A2(239), cc 4440-2(139), 731-1(177), 5091-1(148), 3216-1(221), 4073-1(182), 4440-1(180), cc 4440-2(139), 731-1(177), 5091-1(148), 3216-1(221), 4072-2(148), 950-(151), 250-(164), 950-3(165), 63-1(128), 63-2(169), 63-3(169), 63-3(169), 65-1(206), 65-2(81), 373-8(151), cc 373-29(109), 68-1(167), 241-6(105), 241-29(113) Group B: D68364(206), cc 263(238), D68256(199), D68265(122), D68105(124) and D681001(180); cc where the number in brackets indicates the number of nucleotides between and including the flanking primers and the absence of the genotype cc indicates the likelihood of the presence of the Hutation. Knowledge of the new genetic markers allows the definition of genotypes characteristic cof heterozygous carriers and homozygotes having a HH mutation in their cc genomic DNA, The potential for HH in an individual interferes with the cffectiveness of interferon treatment for hepatitis C infection. By the first of the presence of the presence of the HT may the flanking primars of interferes with the cffectiveness of interferon treatment for hepatitis C infection. By

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cc method comprises assessing genomic DNA from an individual for the CC presence or absence of the HH-associated allele of the base-pair CC polymorphism HHP-1, HHP-19 or HHP-29, and/or at least one non-optional CC marker comprising the following microsatellite repeat alleles of group A CC 184(271), 24E2(245), 2B8(206), 3321-1(197), 4073-1(182), 4440-1(180), CC 184(271), 731-1(177), 5991-1(148), 3216-1(221), 4072-2(148), 950-2(164), 950-3(165), 950-4(128), 950-5(180), 950-6(151), 950-CC 1(142), 950-2(164), 950-3(165), 950-4(128), 950-5(180), 950-6(151), 950-CC 1(142), 950-2(164), 63-1(167), 241-6(105), 65-1(201), 4072-2(148), 950-CC 1(165), 63-1(120), 63-1(619), 63-3(169), 63-1(121), 173-8(151), 273-8(151), 273-2(109), 68-1(167), 241-6(105), 241-29(113) Group B: D68464(206), CC D68306(238), D68258(199), D68265(122), D68105(124) and D681001(180); CC where the number in brackets indicates the number of nucleotides between cand including the flanking primers and the absence of the genotype CC indicates the 1kelihood of the presence of the HH mutation. Knowledge of the new genetic markers allows the definition of genotypes characteristic CC of heterozygous carriers and homozygotes having a HH mutation in their CC genomic DNA. The potential for HH in an individual interferes with the CC diagnosing this potential, the responsiveness of interferon treatment may be absence of interferon treatment may be absenced in the properties and homozygotes having a HH mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

```
The sequences given in AAT71973-2044 represent a series of primer pairs CC which were used to determine the presence or absence of the common CC hereditary haemochromatosis (HH) gene mutation in an individual. The CC method comprises assessing genomic DNA from an individual for the CC presence or absence of the HH-associated allele of the base-pair CC polymorphism HHP-1, HHP-19 or HHP-29, and/or at least one non-optional CC marker comprising the following microsatellite repeat alleles of group A CC 1E4(271), 24E2(245), 2B8(206), 3321-1(197), 4073-1(182), 1A2(239), CC 1E4(271), 24E2(245), 2B8(206), 3321-1(197), 4073-1(182), 4440-1(180), CC 4440-2(139), 731-1(177), 5991-1(148), 3216-1(221), 4072-2(148), 950-2(144), 950-3(165), 950-4(128), 950-5(180), 950-5(180), 950-5(180), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950-6(151), 950
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Determn. of the common hereditary haemochromatosis gene mutation primers based on novel microsatellite repeat flanking sequences c base-pair polymorphisms HHP-1, HHP-19 or HHP-29.

```
The sequences given in AAT71973-2044 represent a series of primer pairs CC which were used to determine the presence or absence of the common CC hereditary haemochromatosis (HH) gene mutation in an individual The CC method comprises assessing genomic DNA from an individual for the CC method comprises assessing genomic DNA from an individual for the CC presence or absence of the HH-associated allele of the base-pair CC polymorphism HHP-1, HHP-19 or HHP-29, and/or at least one non-optional CC marker comprising the following microsatellite repeat alleles of group A CC and optionally of group B: Group A: 19D9(205), 18B4(235), 1A2(239), CC 1E4(271), 24E2(245), 2B8(206), 3321-1(197), 4073-1(182), 4440-1(180), CC 1(142), 950-2(164), 950-3(165), 950-4(128), 950-5(180), 950-6(151), 950-4(128), 950-1(148), 950-6(151), 950-4(128), 950-5(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-1(180), 65-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC genome (represented in AAXI0269-X12937). These primers can be used in a comethod for determining polymorphic forms in an individual for use in e.g. CC method for determinity testing or phenotypic typing for diseases such CC as agammagiobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial CC hypercholesterolemia, polycystic kidney disease, hereditary CC sphercytosis, von Willebrand's disease, tuberous sclerosis, hereditary CC haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos CC syndrome, osteogenesis imperfecta, acute intermittent porphyria, CC autoimmune diseases, inflammation, cancer, diseases of the nervous classification by pathogenic microorganisms, and characteristics such cas longevity, appearance (e.g. baldness, obesity), strength, speed, CC endurance, fertility, and susceptibility or receptivity to particular CC drugs or therapeutic treatments. The isolated polymorphic nucleic acid commonates can also be used to produce medicaments for the treatment or produce medicaments for the treatment or produce medicaments or the treatment or produce medicaments for the treatment or produce medicaments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 1008

A peptide, which binds to a cellular receptor for the chemokine, can also be used to treat breast disease. Antigenic peptides of the chemokine can be used to vaccinate patients against breast disease. The chemokine polynucleotide sequences and the chemokine protein can be detected in samples with primers, probes and antibodies using standard techniques. This is useful for detecting breast disease. Other breast diseases that may be treated or detected with the chemokine and its encoding polynucleotides include inflammations, infections, mastitis, benign cystitis, and benign hyperplasias as well as other malignancies. The present sequence represents a gene-specific primer for amplifying the human mammary associated chemokine (MACK) DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A mammary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Papsidero
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides an isolated human chemokine, which is preferentially expressed in breast tissue or detected in breast milk. An antibody that recognizes the novel chemokine, or a chemokine-derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 28; Page

Crimeric Annivers and the sequences of regions flanking concludes kits for determining the presence or absence of a SNP, using the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC oligonucleotides are useful for determining the presence, absence or CC oligonucleotides are useful for determining the presence, absence or CC oligonucleotides are useful for determining the presence, absence or CC oligonucleotides are useful for determining the presence, absence or CC oligonucleotides apathological phenotypic trait suspected of being CC caused by one or more SNPs. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC diseases including, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial CC diseases, including, rheumatoid arthritis, multiple sclerosis, cc inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and contermity analysis. The present sequence represents a PCR primer specific for a human SNP containing NNA sequence.

Methods for identifying subjects who are afflicted with or carriers of diseases associated with genomic deletion(s), e.g. Van Buchem's disease by determining the presence of a deletion in the 92 kb region of human disease, f human

sample.

The present individuals

invention relates to methods for distinguishing between homozygous for and therefore afflicted with Van Buchem's

homozygous for and therefore

Claim chromosome

disease, individuals heterozygous for and therefore carriers of Van Buchems's disease and individuals who are not afflicted with Van Buchems's disease comprise identifying a large genomic deletion in chromosome 17 at 17g21. The method is useful for identifying individuals who are afflicted with or carriers of diseases associated with one or more genomic deletion, particularly Van Buchem's disease, which is a rare autosomal recessive disorder that results in a bone dysplasia referred to a cranictubular hypertosis. The present sequence is a PCR primer used to amplify 92Kb gene fragment in human chromosome 17 at 17g21

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ş
The invention relates to producing a sub-population of labeled nucleic acids (NAs) comprising contacting a NA sample from a physiological source, with a pool of 50 distinct gene specific primers under suitable conditions to enzymatically generate sub-population of NAs, where each gene specific primer has a sequence complementary to a distinct mRNA, and each labeled NA is generated using a single gene specific primer. The method is useful for producing a sub-population of labeled NAs which is useful for analysing the differences in the RNA profiles between several different physiological sources, where the method comprises producing subpopulation of labeled NAs for the different physiological sources, comprising the populations for each physiological source to identify differences in the population, where the comparison is preferably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Producing sub-population of labeled nucleic acids, useful for analyzing differences in RNA profiles between several different physiological sources, using set of distinct gene specific primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             05-JAN-1999;

\mathcal{L}_{\mathcal{L}}
                                                   performed by hybridising the labeled NAs for each of the distinct physiological sources to an array of probe NAs stably associated with the surface of a substrate to produce a hybridisation pattern for each of the sources, and comparing the patterns for each of the sources, where differential gene expression assays are utilised in differential expression analysis of diseased a normal tissue e.g. neoplastic a normal tissue, or different tissue or subtissue types. The present sequence is a human gene specific PCR primer used in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at http.wipo.seqdata.uspto.gov/sequence.html?DocID=6352829B1

Novel isolated polypeptide containing immunoglobulin and immunoglobulin-like domains and SLAM associated protein, termed CD2000 or CD2001, usefu for treating immune, inflammatory, or hepatic circulatory disorders. useful

Disclosure; Page 75; 138pp; English.

The invention relates to nucleic acid moleculencedes a polypeptide containing immunoglobuland SLAM associated protein (SAP) motifies. Cluseful for treating disorder such as immune immune disorders (e.g. carcinoma), viral inf acid molecule, immunoglobulin acid molecule, designated CD2000 wh immunoglobulin (Ig) and Ig-like dom motifs CD2000 DNA and protein is as immune proliferative disorders, viral infection, autoimmune disor. disorders domains which

CD2000 DNA is used in CC gene therapy. CD2000 DNA is useful in screening assays, detection assays cometicatine (e.g. diagnostic assays, monitoring clinical crials and pharmacogenomics), and in methods of treatment (e.g. camplifying nytimer). The present sequence is human CD2000 DNA camplifying nytimer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to novel CD2000 and CD2001 proteins and CD2001 proteins and CD2001 proteins and polynucleotides encoding such proteins. Sequences of the invention are CC used to treat TH1 disorders, particularly chronic inflammatory diseases, insulin-dependent diabetes, organ specific autoimmunity, psoriasis, graft rejection, contact dermatitis, graft versus host disease or sarcoidosis. The invention is useful to modulate or to identify modulators of immune CC disorders such as lymphoproliferative disorders (e.g., leukaemia or and X -linked lymphoproliferative disease), inflammatory bowel disease such as chronic disease and ulcerative colitis, autoimmune disease such as CC multiple selerosis, inflammatory disorders such as rheumatoid arthritis and asthma, chronic obstructive pulmonary disorders and viral, bacterial, fungal or parasitic infections. The invention is also useful to identify, CC isolate, deplete, track, or modulate the differentiation, replication cCC analso be used to modulate the function, morphology, proliferation also be used to modulate the function morphology, proliferation cCC and therefore can be used to treat disorders such as bronchitis, cystic fibrosis, bronchiolitis, hypersensitivity pneumonitis, emplysema, lung cancer, idiopathic pulmonary fibrosis, pneumonia, jaundice, hepatic failure, hereditary hyper blirubinaemias, hepatic circulatory disorders, malieronari rumours, henatic vair rhrombonia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated mammalian (e.g., human or mouse)
CC lipase polypeptide (polyp), e.g., LPDL (I) or LPDLR polyp (II). (I) or
CC (II) is useful for identifying substances which can bind with LPDL or
CC LPDLR polyp, and for identifying a compound that affects the binding of
CC their nucleic acid is useful for identifying a compound that affects lPDL or
CC their nucleic acid is useful for identifying a compound that affects LPDL
CC or LPDLR polyp activity or expression. (I) or (II) or their nucleic acid
CC increased or detecting or monitoring a condition associated with
CC increased or decreased LPDL or LPDLR expression or activity in an animal,
CC where the condition is lipase deficiency, atherosclerosis, fatty liver
CC disease and dyslipidemias, such as hypercholesterolemia,
CC hypertriglyceridemia, mixed (combined) dyslipidemia, lipid or lipoprotein
CC deficient states, and/or any other tissue or plasma disorders of lipid or
CC lipoprotein metabolism. The nucleic acid is useful for diagnosing the
CC involves detecting a germline alteration in the nucleic acid in the
CC subject. An inhibitor is useful for modulating triglyceride activity by
CC inhibiting expression or activity of (I) or (II). The nucleic acid is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 1015
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 7; Page 22 (disclosure); 33pp; Chinese.

The invention relates to a human protein designated 10.01, containing the phe-His aminolyase active site. Also disclosed are the encoding polynucleotide, and a method for preparing the polypeptide by DNA recombination. The application of the polypeptide is in treating arrhythmia and diabetes. Also disclosed are the antagonist against polypeptide and its therapeutic action, and the application of the polypeptide. The current sequence represents a human protein 10.
                                  The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, huma genetic analysis such as linkage analysis of genetic disease, commercia animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(GC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The primers ANT65798-766047 were used to Pamplify the inserts from the isolated clones containing the repeat sequences. The primers ANT66002-3 were used to amplify the repeat primers ANT670410 (ANTA) and the repeat primers ANT670410 (ANTA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 41 BP; 6 A; 17 C; 9 G; 9 T; 0 U;

                                                                                                                                                                                                 The present sequence is that of interspersed repeated sequence PCR (IRS-PCR) primer ALU3' used to identify human-specific sequences in yeast artificial chromosomes (YAC) derived from the human chromosome 1923.3-q24 region. The chromosomeal region contains the locus associated with absorptive hypercalciuria (AH). IRS-PCR fingerprints were generated, and genes contained within YACs were identified by exon trapping. cDNA corresponding to the AH gene was isolated (see AAZ33376). Identification of the AH genomic region allows genetic screening for increased risk of
                                                                                                                                                                                                                                                                                                                           Novel genomic region useful in screening osteoporosis with hypercalciuria.

The human version of the gene is found on chromosome 17p. Some alleles cause a predisposition to cancer, particularly prostate cancer. This gene and it protein can be used in peptide and gene therapy for cancer patients, as well as being useful as diagnostic tools (both for cancer sufferers and those with a predisposition to the disease) and in the production of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A novel method for determining a predisposition in a subject to a complex CC polygenic disease involves assaying chromosome 1 for a genetic marker CC indicative of a predisposition to the disease. This method may be used CC for determining predisposition to the disease. This method may be used CC determining predisposition to cardiovascular disease, coronary artery CC disease, non-insulin dependent diabetes mellitus, neuropathy in NIDDM, CC essential hypertension, hyperlipidemia and diabetic neuropathy. The CC method can be used for testing an individual with a family history or in CC the early stages of a complex polygenic disease to ascertain the chance of developing hypertension, neuropathy or lipid disturbances such as high CC total cholesterol, high low density lipoprotein cholesterol, abnormal CC total cholesterol, high low density lipoprotein cholesterol, abnormal CC apolipoprotein Al and abnormal glycosylated haemoglobin. Once a complex CC polygenic disease disposition has been identified the subject can be trasted to prevent or reduce the disease or delay its onset. The genetic CC marker used in the method is DIS2334 and includes a CA repeat region in CC (INFRSF1B) gene. The marker is located at chromosome 1936.2. The present complex equence is the reverse PCR primer used for detection of the mired to mirror as found to be linked to mirror to be complex primer used for detection of the complex processes and the complex processes and the complex processes and the present complex processes and the present processes and the processes

platelet activation. The method comprises the adminstration of specific modulators of protease-activated receptor 1 (PAR1) and protease-activated receptor 2 (PAR4) activity. The invention also encompasses an anti-PAR4 creatibody directed against all or part of a thrombin-binding site of PAR4. The method is useful for reducing the level of a thrombin response in a mammal or for preventing disorders such as thromboembolism in individuals with a history of thrombosis. Inhibitory compositions are useful in the treatment of disorders such as myocardial infarction, stroke, pulmonary cumbolism, deep vein thrombosis (DVT), peripheral arterial occlusion and cother blood system thromboses. Activating compositions are useful in the treatment of disorders involving insufficient clotting, where dual activation of PAR1 and PAR4 may increase activation of platelets, since thrombin has the ability to activate both receptors. A PAR4 antibody is thrombin mediated platelet activation. The present sequence represents to thrombin-mediated platelet activation. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of modulating thrombin-mediated platelet activation. The method comprises the adminstration of specific

CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The colligonucleotides are useful for determining the presence, absence or colligonucleotides are useful for determining the presence, absence or clientity of a SNP and for genotyping nucleic acid samples, for e.g. to cases by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Myhan syndrome, muscular cystrophy, familial hypercholesterolaemia, polycystic kidney disease, costeogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial colleases, including, rheumatoid arthritis, multiple sclerosis, pathogenic inflammation, cancer, nervous system diseases and infection by pathogenic inflammation, cancer, nervous system diseases and infection by pathogenic management in the second of

CC primer extension (SNPE) primers, and the sequences of regions flanking considers of single nucleotide polymorphisms SNPs. The present invention considers with the for determining the presence or absence of a SNP, using the cligonucleotides of the invention. The PCR primers are used to amplify a component state of ignorphisms of the invention. The PCR primers are used to amplify a component state of the invention. The PCR primer are used to amplify a component state of the invention. The primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence or considered the primer extension reaction. The constant of a SNP and for genotyping nucleic acid samples, for e.g. to disently of a SNP and for genotyping nucleic acid samples, for e.g. to cases by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic traits include diseases e.g. cagamaglobulinaemia, diabetes insipidus, teach-Nyhan syndrome, muscular constants also include symptoms of or susceptibility to multifactorial constants also include symptoms of or susceptibility to multifactorial confissase of which a component is or may be genetic such as autoimmune confissases, including, rheumatoid acute intermittent porphyria. Phenotypic inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and confissassion of the present sequence represents a PCR primer specific for a human SNP containing NNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide comprimer extension (SNPE) primers, and the sequences of regions flanking concludes kits for determining the presence or absence of a SNP, using the collides kits for determining the presence or absence of a SNP, using the collidonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence or conjugate the primer extension reaction. The coligonucleotides are useful for determining the presence, absence or conjugate the primer extension reaction. The coligonucleotides are useful for determining the presence, absence or conjugate the primer extension reaction. The coligonucleotides are useful for determining the presence, absence or conjugate the presence and individual or group of conjugate the presence and individual or group of conjugate the presence of the primer cannot supplied the primer individual or group of conjugate the presence of the primer cannot supplied the primer individual or group of conjugate the presence of the primer cannot supplied the primer individual or group of conjugate the presence of the primer cannot supplied the primer cannot be primer ca

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking concludes kits for determining the presence or absence of a SNP, using the Oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The Oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid sample by cassess by association analysis the genotype of an individual or group of cassess by association analysis the genotype of an individual or group of casses by association analysis the genotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. cagammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular cystrophy, familial hypercholesterolaemia, polycystic kidney disease, costeogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial diseases, including, rheumatoid arthritis, multiple sclerosis, confidences, including, rheumatoid arthritis, multiple sclerosis, microgenic method is also useful in forensic investigations and confidence in human SNP containing DNA sequence represents a PCR primer specific for a human SNP containing DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        <u>.</u>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SNP flanking sequence, the SNPE primer is used as a genotyping primer.

The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autotimmune diseases, including, rheumatoid arthritis, multiple sclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

CC performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to CC assess by association analysis the genotype of an individual or group of CC individuals, having a pathological phenotype traits include diseases e.g. CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease, CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic CC traits also include symptoms of or susceptibility to multifactorial CC disease of which a component is or may be genetic such as autoimmune CC diseases, including, rheumatoid arthritis, multiple sclerosis, CC inflammation, cancer, nervous system diseases and infection by pathogenic CC microorganism. The method is also useful in forensic investigations and CC paternity analysis. The present sequence represents a PCR primer specific
                                                                                                                                                                                                                                                                                                                                                                                                                                 primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to the isolation of novel human and mouse VMGLOM polypeptides (long form and short form), and the nucleic acid molecules encoding them. VMGLOMS (also referred to as glomulins) are a subtype of venous malformations (VMS) called glomangiomas. In humans, VMGLOM has been mapped to chromosome 1p21-22. VMGLOMs and the nucleic acids encoding for them are useful as a medicament or for incorporation into a diagnostic kit. Such medicaments are useful for preventing, treating or alleviating disorders with a vascular component, particularly where alteration of vascular smooth muscle cell phenotype is needed, e.g. varicosities, cardiopathies or cardiomyopathies, cerebral disorders and cancer. The nucleic acids are also useful in gene therapy. The present sequence for reverse PCR primer is used to isolate novel CA repeats from PAC 612c19 (56CA1) clone in the methods of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2001-557643/62.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to the isolation of novel human and mouse VMGLOM polypeptides (long form and short form), and the nucleic acid molecules encoding them. VMGLOMS (also referred to as glomulins) are a subtype of venous malformations (VMS) called glomanglomas. In humans, VMGLOM has been mapped to chromosome 1p21-22. VMGLOMS and the nucleic acids encoding for them are useful as a medicament or for incorporation into a diagnostic kit. Such medicaments are useful for preventing, treating or alleviating disorders with a vascular component, particularly where alteration of vascular smooth muscle cell phenotype is needed, e.g. varicosities, cardiopathies or cardiomyopathies, cerebral disorders and cancer. The nucleic acids are also useful in gene therapy. The present sequence for forward PCR primer is used to isolate novel CA repeats from
The invention relates to a method for determining the metastatic potential of cancer cells derived from a subject with cancer. The method comprises introducing a cancer cell sample into the upper chorioallantoic membrane (CAM) of an avian embryo into which an artificially generated air pocket has been created, incubating the embryo for intravasation to occur, and detecting migration of the cancer cells from the upper CAM to the lower CAM. The present sequence was used to selectively amplify human specific Alu repeat sequences, which will be present in the cancer cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Page 71; 157pp; English

This procedure enables detection of the migration of inoculated cancer cells into the lower CAM. The method is useful for measuring the metastatic potential of cancer cells, for measuring the ability of the cancer cells to invade blood vessels, and as a drug screening assay for the identification of agents having antimetastatic activity and thereby modulating the metastatic potential of cancer cells. The method may also be used to screen for agents capable of inhibiting cancer cell intravasation, and to detect phenotypic changes effected by genetic manipulation of cancer cells that result in changes
                                                                            Sequence 19
                                                                                                                                                                                             The present invention describes the human Zmax1 gene and the high bone mass (HBM) gene, which are found on chromosome 11q13.3. The Zmax1 and HBM genes have osteopathic activities. The genes can be used in gene therapy, antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, the diagnosis and treatment of bone disorders including osteoporosis,
                                                                                                                                                                                                                                                                                                                                                                                                       New high bone mass (HBM) modulating bone mass for

                                                                                                                                                                            The invention relates to a human prostate cancer predisposing gene coding for an HPC2 polypeptide. The DNA and protein sequences are useful as diagnostic reagents for identifying a mutant HPC2 nucleotide sequence in a suspected mutant HPC2 allele by comparing the sequence of the suspected mutant HPC2 allele with a wild-type HPC2 sequence. The sequences are also useful for detecting an alteration in HPC2, where the alteration is associated with cancer in a human. The method involves analysing an HPC2 gene or an HPC2 gene expression product from a tissue of the human. The HPC2 gene is useful as a marker for prostate cancer and can be used in gene therapy techniques to suppress neoplastic growth of recipient cells which carry the mutant HPC2 allele. The sequences represent primers used in the methods of the invention, cDNA encoding human and mouse HPC2 and contains the methods of the invention, cDNA encoding human and mouse HPC2 and contains the methods of the invention, cDNA encoding human and mouse HPC2 and contains the methods of the invention, cDNA encoding human and mouse HPC2 and contains the methods of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nucleic acid sequence encoding HPC2 polypeptide, which is marker for prostate cancer, is useful in gene therapy techniques to restore HPC2 normal levels by which neoplastic growth is suppressed in recipient cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; mouse; HPC2; prostate c

                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method of arraying genome clones. The cmethod comprises: (a) clones of the genomic libraries contained in cmultiwell plates numbered for discrimination are mixed in each of the cmultiwell plates; (b) a primer designed based on the chromosome marker (c) a signal corresponding to the marker is detected from the resultant camplified product to specify the discrimination Nos. of the multiwell confidence is changed so that the same discrimination Nos. of the multiwell confidence is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell confidence; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell confidence; (e) the clones in the multiwell plates of the specified confidence; (e) the clones in the multiwell plates of the specified conditateral directions; (f) the mixed clones are cultured and the cresultant cultures are amplified by using the above primer; (g) signals are detected from the amplified by using the above primer; (g) signals are detected from the detected result; and (i) the clones are mixed respectively in each wells of longitudinal constituted as the positions on the chromosome and arrayed. The mixed are specified from the detected result; and (i) the clones are constituted as the positions on the chromosome and arrayed. The mixed primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                      Ş

The present invention describes a method of arraying genome clones. The centrod comprises: (a) clones of the genomic libraries contained in completes numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker centroduct to specify the discrimination Nos. of the multiwell camplified product to specify the discrimination Nos. of the multiwell centroduct to specify the discrimination Nos. of the multiwell centre containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell centre; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell centre; (e) the clones in the multiwell plates of the specified discrimination Nos. to are mixed respectively in each wells of longitudinal central directions; (f) the mixed clones are cultured and the centre detected from the amplified by using the above primer; (g) signals are detected from the detected result; and (i) the clones are microarray is useful for gene analysis. ABL42957 to ABL45322 represent pCR primers for human chromosome 21922.1, which are specifically claimed for use in the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method of arraying genome clones. The commethod comprises: (a) clones of the genomic libraries contained in method comprises: (a) clones of the genomic libraries contained in committies plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant camplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified condiscrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals cand lateral directions; (f) the mixed clones are cultured and the cromation Nos. of the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABIA2957 to ABIA5322 represent PCR primers for human chromosome 136-35 DNA, and ABIA5323 rob ABIA634 creptesent PCR primers for human chromosome 21q22.1, which are

WPI; 2002-439993/47.

Examining allergosis, involves measuring the expression levels of a specific gene, and comparing it to the levels in the eosinophils of specific gene, a healthy control.

Example 1; Page 14; 20pp; Japanese

The specification describes a method for examining allergosis. The method comprises measuring the expression level of the gene given in ABL59037, and comparing it with the expression level of the gene in the eosinophils

The invention relates to a method for identifying a molecule involved in lipid regulation comprising identifying a molecule that binds to or inhibits binding of a molecule to high bone mass (HBM) or its wild type gene, Zmax1. Compounds identified by the method are useful for treating, Cd dispossing, preventing or screening for normal and abnormal lipid-cassociated conditions, including arteriosclerosis, cardiovascular Cd disease, stroke, and osteoporosis. The compounds may also be used in the treatment or prevention of diabetic atherosclerosis, neurovascular CC conditions caused by plaque build-up, poor circulation due to plaque build-up and associated poor wound healing. The methods may be used in CG gene therapy, pharmaceutical development, and diagnostic assays for bone development disorders. Molecules identified by comparison of Zmax1 and CC development, in diagnosis of human or animal bone disease, and in the treatment of bone diseases. Sequences hak22776-ABK23411 represent cDNA cmolecules encoding human Zmax1 and HBM, and PCR primers, probes, linkers and adapters of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                    was used to produce a human 14273 probe (see ABQ81233), which was used to examine the expression profile of 14273. It was found that 14273 colored to molecules are expressed at high levels in adipose tissue, e.g. white adipose tissue and brown adipose tissue, as well as in pancreatic islets. They are upregulated during exposure to cold (i.e. under conditions that affect brown or white adipocyte metabolism) and downregulated in genetic models of obseity. The present invention provides 14273 nucleic acids, colypeptides and antibodies useful for the diagnosis and treatment of metabolic disorders including obseity, anorexia, cachexia and diabettes. Also provided are methods for identifying a subject having a metabolic activity, methods for modulating metabolic activity, methods for modulating metabolic activity, methods for modulating metabolic activity, methods for nipolysis in a subject, and a method for modulating lipogenesis or lipolysis in a subject, and a method for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                      The present invention relates to novel proteins (I) referred to as NOVX, where X is any number from 1 to 18, and their coding sequences (II) (see ADH47704-ADH47759). The proteins and their coding sequences are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder such as metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, funcial halistics, obesity, infectious diseases (viral, bacterial,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antidiabetic; anorectic; cardiant; hypotensive; antiarteriosclerotic; anorectic; virucide; antibacterial; fungicide; protozoacide; nootropic; neuroprotective; antiparkineonian; anticonvulsant; osteopathic; antiarthritic; antiinflammatory; dermatological; antiasthmatic; antiinflammatory; dermatological; antiasthmatic; antilipaemic; Gene therapy; human; metabolic disorder; diabetes; obesity; viral infection; bacterial infection; fungal infection; viral infection; protozoal infection; anorexia; cancer; cardiovascular disease; neurodegenerative disorder; Alzheimer's disease; parkinson's disease; pentegos; immune disorder; haemacopojetic disorder; inflammatory skin disorder; asthma; dyslipidaemia; NOV14; PCR; primer;

       The invention relates to novel transgenic animals expressing the high bone mass (HBM) gene, expressing the corresponding wild type HBM gene, comprising an alteration of the gene encoding LRP5 or LRP6, or expressing an LRP5 that is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are for the study of bone density modulation or bone mass modulation. The invention has osteopathic and cytostatic activity. The polynucleotides of the invention may have a use in gene therapy. The transgenic animals and bone mass is modulated relative to non-transgenic animals of the same species in more than one parameter selected from bone density, bone strength, trabecular number, bone size, or bone tissue connectivity. The transgenic animals, nucleic acids and methods are useful for identifying.
                                                                                                                                                                                                                                                                                                                                                                                                                   11-MAY-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              compositions, which may be employed for treating or preventing bone diseases, e.g. osteoporosis, osteomalacia, rickets, Paget's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, or characterised by reduced bone density or mass. The present sequence is
                                                                                                                                                                  The present invention relates to High Bone Mass (HBM), LRP5 (Zmax1) and LRP6 (mutants, which results in a HBM-like phenotype when expressed in a cell. The HBM-like phenotype results in bone mass modulation and/or lipid level modulation. The invention is useful for diagnosing a HBM-like phenotype in a subject and for preparing a composition for modulating bone mass and/or lipid levels in a subject suffering from e.g. osteoporosis. The present sequence is a Sequence Tagged Site (STS) maker, which was used to prepare a physical map of the Zmax1 (LRP5) gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           11-MAY-2001; 2001US-0290071P.

                                                                                                                                                                                              The invention relates to short interfering nucleic acids (siNA) which CC downregulate expression of the human interleukin-2 gene by RNA CC interference. The siNAs may or may not comprise ribonucleotides and may CC interference. The siNAs may or may not comprise sense and antisense CC regions, or alternatively are assembled from a sense oligonucleotide and CC an antisense oligonucleotide. Specifically, the siNAs include short CC interfering RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short CC chairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, CC can contain deoxyribonucleotides, and can be chemically synthesised, CC expressed from a vector or enzymatically synthesised. The invention also CC and/or complexes of siRNA; and vectors that express siNA. The siNAs are CC and/or complexes of siRNA; and vectors that express siNA. The siNAs are CC used for treating cancer, restenosis and polycystic kidney disease. The CC used for treating cancer, restenosis and polycystic kidney disease. The CC identification and validation, genetic engineering, pharmacogenomics, CC studying gene function, and gene mapping (e.g., of single nucleotide CC polymorphisms). The present sequence represents the upper strand of a CC the interleukin-2-targeted double-stranded siNA, which is identical to CC content interleukin-2-targeted double-stranded siNA, which is identical to CC the interleukin-2-targeted souls enterleukin-2 target sequence.
                                                                           Matches
                                                                                         Query Match

                                                      The invention relates to short interfering nucleic acids (siNA) which CC downregulate expression of the human interleukin-2 gene by RNA CC interference. The siNAs may or may not comprise ribonucleotides and may CC be double or single stranded. They further comprise sense and antisense CC regions, or alternatively are assembled from a sense oligonucleotide and CC an antisense oligonucleotide. Specifically, the siNAs include short CC interfering RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short CC hairpin RNA (shRNA). The siNAs can be unmodified or chemically modified, CC can contain deoxyribonucleotides, and can be chemically synthesised, CC expressed from a vector or enzymatically synthesised. The invention also CC relates to kits for the in vitro or in vivo delivery of siRNA; conjugates and/or complexes of siRNA; and vectors that express siNA. The siNAs are CC used to modulate expression of the interleukin-2 gene in cells, tissue CC explants or organisms (e.g., by ex vivo gene therapy), or in grafts and Ct transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis and polycystic kidney disease. The CC identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide CC polymorphisms). The present sequence represents the lower strand of a human interleukin-2-targeted double-stranded siNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of an interleukin gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               06-JUN-2002;

cc interference. The siNAs may or may not comprise ribonucleotides and may comparison of the human interleukin-2 gene by RNA cc be double or single stranded. They further comprise sense and antisense cc regions, or alternatively are assembled from a sense oligonucleotide and cc an antisense oligonucleotide. Specifically, the siNAs include short cc interfering RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short cc interfering respectively. The siNAs can be unmodified or chemically modified, can contain decoxyribonucleotides, and can be chemically synthesised. Cc expressed from a vector or enzymatically synthesised. The invention also cc relates to kits for the in vitro or in vivo delivery of siRNA; conjugates can deduce the conjugates of siRNA, and vectors that express siNA. The siNAs are cc used to modulate expression of the interleukin-2 gene in cells, tissue cc explants or organisms (e.g., by ex vivo gene therapy), or in grafts and ct ransplants for the treatment of a variety of conditions. They may be complicated the construction and contained construction, genetic engineering, therapeutic target cc identification and validation, genetic engineering, pharmacogenomics, cc studying gene function, and gene mapping (e.g., of single nucleotide cc human interleukin-2-targeted double-stranded siNA.

         regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siRNA; conjugates and/or complexes of siRNA; and vectors that express siNA. The siNAs are used to modulate expression of the interleukin-2 gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cytostatic; vasotropic; nephrotropic; cancer; restenosis; polycystic kidney disease; RNA interference; short interfering nucleic acid; siNA; short interfering R double-stranded RNA; micro-RNA; miRNA; short hairpin RNA;
